Logic and Languages

There is a strong link between formal languages and logical systems.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Logic and Languages

There is a strong link between formal languages and logical systems.

Rational languages \longleftrightarrow Finite monoids \longleftrightarrow MSO sentences

Star-free language \longleftrightarrow Aperiodic monoids \longleftrightarrow FO sentences

Logic and Languages

There is a strong link between formal languages and logical systems.

Rational languages \longleftrightarrow Finite monoids \longleftrightarrow MSO sentences

Star-free language \longleftrightarrow Aperiodic monoids \longleftrightarrow FO sentences

► Eg.: $\exists x (\mathbf{a}(x) \land (\forall y (x < y) \implies \mathbf{b}(y)))$ defines the language $A^* a b^*$

Logic and languages

Fragments of **FO**

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶

Fragments of **FO**

Fragment: formulae closed under \land , \lor and quantifier free substitution.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Fragments of **FO**

Fragment: formulae closed under \wedge, \vee and quantifier free substitution. Natural fragments?

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Fragments of **FO**

Fragment: formulae closed under \wedge, \vee and quantifier free substitution. Natural fragments?

Considering local predicates: order [<], successor [+1], min, max

Fragments of **FO**

Fragment: formulae closed under \wedge, \vee and quantifier free substitution. Natural fragments?

Considering local predicates: order [<], successor [+1], min, max

syntactic restrictions \rightarrow quantifier alternation: $\Sigma_k : \underbrace{\exists^* \forall^* \dots}(\varphi)$,

 $\Pi_k: \underbrace{\forall^* \exists^* \dots}_k (\varphi)$ (\varphi quantifier free)

Fragments of $\ensuremath{\textbf{FO}}$

Fragment: formulae closed under \wedge, \vee and quantifier free substitution. Natural fragments?

Considering local predicates: order [<], successor [+1], min, max

syntactic restrictions \rightarrow quantifier alternation: $\Sigma_k : \exists^* \forall^* \dots (\varphi)$,

 $\Pi_k: \underbrace{\forall^* \exists^* \dots}_k (\varphi)$ (\varphi quantifier free)

or by limiting no. of variables: for example $FO^{2}[<]$

Fragments of $\ensuremath{\textbf{FO}}$

Fragment: formulae closed under \wedge, \vee and quantifier free substitution. Natural fragments?

Considering local predicates: order [<], successor [+1], min, max

syntactic restrictions \rightarrow quantifier alternation: $\Sigma_k : \exists^* \forall^* \dots (\varphi)$,

 $\Pi_k: \underbrace{\forall^* \exists^* \dots}_k (\varphi)$ (\varphi quantifier free)

or by limiting no. of variables: for example $FO^2[<]$

or both? - $\Sigma_1^{FO^2}[<]$

Fragments of $\ensuremath{\textbf{FO}}$

Fragment: formulae closed under \wedge, \vee and quantifier free substitution. Natural fragments?

Considering local predicates: order [<], successor [+1], min, max

syntactic restrictions \rightarrow quantifier alternation: $\boldsymbol{\Sigma}_{k} : \underbrace{\exists^{*} \forall^{*} \dots}_{k} (\varphi),$

 $\Pi_k: \underbrace{\forall^* \exists^* \dots}_k (\varphi)$ (\varphi quantifier free)

or by limiting no. of variables: for example $FO^{2}[<]$

or both? - $\pmb{\Sigma}_1^{\text{FO}^2}[<]$

In this way we get a plethora of fragments. Eg. - $\Sigma_1[<, max]$, FO²[<, +1]

Fragments of $\ensuremath{\textbf{FO}}$

Fragment: formulae closed under \wedge, \vee and quantifier free substitution. Natural fragments?

Considering local predicates: order [<], successor [+1], min, max

syntactic restrictions \rightarrow quantifier alternation: $\boldsymbol{\Sigma}_{k} : \underbrace{\exists^{*} \forall^{*} \dots}_{k} (\varphi),$

 $\Pi_k: \underbrace{\forall^* \exists^* \dots}_k (\varphi)$ (\varphi quantifier free)

or by limiting no. of variables: for example $FO^{2}[<]$

or both? - $\pmb{\Sigma}_1^{\text{FO}^2}[<]$

In this way we get a plethora of fragments. Eg. - $\Sigma_1[<, max]$, FO²[<, +1]

What about non-FO definable predicates?

Logic and languages

Modulo predicates

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Modulo predicates

Definition

For any $d \in \mathbb{N}$, $0 \le i < d$ we have $\mathbf{mod}_i^d(x)$: $w, [x = j] \models \mathbf{mod}_i^d(x)$ iff $i \equiv j \pmod{d}$

Modulo predicates

Definition

For any $d \in \mathbb{N}$, $0 \le i < d$ we have $\mathbf{mod}_i^d(x)$: $w, [x = j] \models \mathbf{mod}_i^d(x)$ iff $i \equiv j \pmod{d}$

$$\mathsf{MOD}^d = \bigcup \{\mathsf{mod}_i^d : i < d\}, \mathsf{MOD} = \bigcup \mathsf{MOD}^d$$

Modulo predicates

Definition

For any $d \in \mathbb{N}$, $0 \le i < d$ we have $\mathbf{mod}_i^d(x)$: $w, [x = j] \models \mathbf{mod}_i^d(x)$ iff $i \equiv j \pmod{d}$

$$\begin{split} \mathsf{MOD}^d = \bigcup \{\mathsf{mod}_i^d \colon i < d\}, \mathsf{MOD} = \bigcup \mathsf{MOD}^d \\ (aa)^* \to \forall x (\mathsf{a}(x) \land (\mathit{max}(x) \implies \mathsf{mod}_0^2(x))) \end{split}$$

Modulo predicates

Definition

For any $d \in \mathbb{N}$, $0 \le i < d$ we have $\mathbf{mod}_i^d(x)$: $w, [x = j] \vDash \mathbf{mod}_i^d(x)$ iff $i \equiv j \pmod{d}$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQ@

$$\begin{split} \mathsf{MOD}^d &= \bigcup \{\mathsf{mod}_i^d \colon i < d\}, \mathsf{MOD} = \bigcup \mathsf{MOD}^d \\ (aa)^* &\to \forall x (\mathsf{a}(x) \land (\mathit{max}(x) \implies \mathsf{mod}_0^2(x))) \end{split}$$

 $\{w : |w|_a \text{ is even}\}$ is not definable in FO[<, MOD].

Modulo predicates

Definition

For any $d \in \mathbb{N}$, $0 \le i < d$ we have $\mathbf{mod}_i^d(x)$: $w, [x = j] \vDash \mathbf{mod}_i^d(x)$ iff $i \equiv j \pmod{d}$

$$\mathbf{MOD}^{d} = \bigcup \{\mathbf{mod}_{i}^{d} : i < d\}, \mathbf{MOD} = \bigcup \mathbf{MOD}^{d}$$
$$(aa)^{*} \to \forall x (\mathbf{a}(x) \land (max(x) \implies \mathbf{mod}_{0}^{2}(x)))$$

 $\{w : |w|_a \text{ is even}\}\$ is not definable in FO[<, MOD].

FO[<, MOD] is more powerful than FO[<]

State of the art

Adding modular predicates - State of the art

The membership and separation problems have been studied for a lot of different fragments.

For successor:

- ► For varieties, Straubing defined an operation V → V * D based on the wreath product of monoids. This corresponds to adding successor to the fragment.
- ► Place and Zeitoun have defined a language operation C → C ∘ SU and proved that it amounts to adding successor

For modulo predicates

- ▶ Barrington et al proved membership decidability for FO[<, MOD]
- Dartois and Paperman proved the decidability of membership of *F*[<, MOD] for several fragments

Separability

(ロ)、(型)、(E)、(E)、 E) の(の)

Separability

Question: If separation is decidable for \mathcal{F} , is it decidable for $\mathcal{F}[MOD]$?

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Separability

Question: If separation is decidable for \mathcal{F} , is it decidable for $\mathcal{F}[MOD]$?

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Answer: Yes, if \mathcal{F} has successor in its signature.

Separability

Question: If separation is decidable for \mathcal{F} , is it decidable for $\mathcal{F}[MOD]$?

Answer: Yes, if \mathcal{F} has successor in its signature.

Theorem

Let $\mathbb S$ be a logical signature containing +1. Let $\mathcal F[\mathbb S]\text{-separation}$ be decidable. Then, $\mathcal F[\mathbb S, \textbf{MOD}]\text{-separation}$ is decidable.

Words in A^* can be cut into blocks

Block abstraction

Given an alphabet A and number d, A_d^* words of length $\leq d$

Words in A^* can be cut into blocks aaaabbabab \rightarrow [aaa][abb][aba][b]

 $\mu_d: A^* \to A_d^*$ $a_1 a_2 \dots a_n \mapsto [a_1 a_2 \dots a_d] [a_{d+1} a_{d+2} \dots a_{2d}] \dots [a_{kd+1} \dots a_{kd+r}]$

Block abstraction

Given an alphabet A and number d, A_d^* words of length $\leq d$

Words in A^* can be cut into blocks aaaabbabab \rightarrow [aaa][abb][aba][b]

 $\mu_d: A^* \to A_d^*$ $a_1 a_2 \dots a_n \mapsto [a_1 a_2 \dots a_d] [a_{d+1} a_{d+2} \dots a_{2d}] \dots [a_{kd+1} \dots a_{kd+r}]$

 $\|\mathscr{C}\|_d = \{L: \exists K \in \mathscr{C} \text{ such that } L = \mu_d^{-1}(K)\}$

Block abstraction

Given an alphabet A and number d, A_d^* words of length $\leq d$

Words in A^* can be cut into blocks aaaabbabab \rightarrow [aaa][abb][aba][b]

 $\mu_d: A^* \to A_d^*$ $a_1 a_2 \dots a_n \mapsto [a_1 a_2 \dots a_d] [a_{d+1} a_{d+2} \dots a_{2d}] \dots [a_{kd+1} \dots a_{kd+r}]$

 $\|\mathscr{C}\|_d = \{L: \exists K \in \mathscr{C} \text{ such that } L = \mu_d^{-1}(K)\}$

Definition

The block abstraction of \mathscr{C} is

$$\|\mathscr{C}\| = \bigcup_{d\in\mathbb{N}} \|\mathscr{C}\|_d$$

Modular enrichment

Now we will move on to the second part of the proof, which relates the enrichment of the fragment with modular predicates to the class transformation defined earlier.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQ@

Modular enrichment

Now we will move on to the second part of the proof, which relates the enrichment of the fragment with modular predicates to the class transformation defined earlier.

Enrichment result. Let \mathscr{C} be the class of languages definable in $\mathcal{F}[\mathbb{S}]$ with $+1 \in \mathbb{S}$. Then, $\|\mathscr{C}\|$ is the class of languages definable in $\mathcal{F}[\mathbb{S}, MOD]$.

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

Proof of enrichment result

Showing $\|\mathscr{C}\|$ languages are definable in $\mathcal{F}[\mathbb{S}, \textbf{MOD}]$ is easy.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Proof of enrichment result

Showing $\|\mathscr{C}\|$ languages are definable in $\mathcal{F}[\mathbb{S}, \mathbf{MOD}]$ is easy.

It involves transforming a $\mathcal{F}[\mathbb{S}](A_d^*)$ describing a language K into a formula $\mathcal{F}[\mathbb{S}, \mathbf{MOD}](A^*)$ which describes $\mu_d^{-1}(K)$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Proof of enrichment result

Showing $\|\mathscr{C}\|$ languages are definable in $\mathcal{F}[\mathbb{S}, \mathbf{MOD}]$ is easy.

It involves transforming a $\mathcal{F}[\mathbb{S}](A_d^*)$ describing a language K into a formula $\mathcal{F}[\mathbb{S}, \mathbf{MOD}](A^*)$ which describes $\mu_d^{-1}(K)$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

We do this by describing blocks using the successor predicate.

Proof of enrichment result

Showing $\|\mathscr{C}\|$ languages are definable in $\mathcal{F}[\mathbb{S}, \mathbf{MOD}]$ is easy.

It involves transforming a $\mathcal{F}[\mathbb{S}](A_d^*)$ describing a language K into a formula $\mathcal{F}[\mathbb{S}, \mathbf{MOD}](A^*)$ which describes $\mu_d^{-1}(K)$

We do this by describing blocks using the successor predicate.

Eg: the following formula

$$\exists x([aba](x))$$

over A^3 is transformed to

 $\exists x_1 \, x_2 \, x_3(\mathsf{mod}_0^3(x_1) \land (x_3 = x_2 + 1) \land (x_2 = x_1 + 1) \land \mathsf{a}(x_1) \land \mathsf{b}(x_2) \land \mathsf{a}(x_3))$

Proof of enrichment result

For the other direction, it is sufficient to prove the result using an Ehrenfeucht-Fraïsse game argument for $\mathcal{F} = FO$.

Proof of enrichment result

For the other direction, it is sufficient to prove the result using an Ehrenfeucht-Fraïsse game argument for $\mathcal{F} = FO$.

To prove that if $L \notin ||\mathscr{C}||_d$, then L is not definable in $\mathbf{FO}[<, +, \mathbf{MOD}^d]$.

[aba][bba][bab][ba]

For $G'(w_1, w_2)$ abababba ababbababba

(ロ)、(型)、(E)、(E)、 E) の(の)

EF games for modulo predicates

Strategy Transfer

For
$$G(\mu_d(w_1), \mu_d(w_2))$$
For $G'(w_1, w_2)$ $[aba][bab][ba]$ $abababba$ $[aba][bba][bab][ba]$ $ababbabbabba$

Round i - Spoiler plays x_i on w₁ in G'

EF games for modulo predicates

Strategy Transfer

For
$$G(\mu_d(w_1), \mu_d(w_2))$$
For $G'(w_1, w_2)$ $[aba][bab][ba]$ $abababba$ $[aba][bba][bab][ba]$ $ababbabbabba$

Round i - Spoiler plays x_i on w₁ in G'

EF games for modulo predicates

Strategy Transfer

- For $G(\mu_d(w_1), \mu_d(w_2))$ For $G'(w_1, w_2)$ [aba][bab][ba]abababba[aba][bba][bab][ba]ababbabbabba
 - Round i Spoiler plays x_i on w₁ in G'
 - Simulate Spoiler playing position $\lfloor x_i/d \rfloor$ on $\mu_d(w_1)$ in G

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

EF games for modulo predicates

Strategy Transfer

- For $G(\mu_d(w_1), \mu_d(w_2))$ For $G'(w_1, w_2)$ [aba][bab][ba]abababba[aba][bba][bba][bba][bba]ababbabba
 - Round *i* Spoiler plays x_i on w_1 in G'
 - ▶ Simulate Spoiler playing position $p_i = \lfloor x_i/d \rfloor$ on $\mu_d(w_1)$ in G
 - Get position q_i played by Duplicator according to his winning strategy in G

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

EF games for modulo predicates

Strategy Transfer

For $G(\mu_d(w_1), \mu_d(w_2))$	For $G'(w_1, w_2)$
[aba] <mark>[bab]</mark> [ba]	aba <mark>b</mark> abba
[aba][bba][<mark>bab</mark>][ba]	ababbababba

- Round i Spoiler plays x_i on w₁ in G'
- Simulate Spoiler playing position $p_i = \lfloor x_i/d \rfloor$ on $\mu_d(w_1)$ in G
- Get position q_i played by Duplicator according to his winning strategy in G
- Play position y_i = (q_i ∗ d + x_i(mod d)) on µ_d(w₂) in G'. Then move to round i + 1

 Trivial to prove that Duplicator wins using the strategy described earlier.

- Trivial to prove that Duplicator wins using the strategy described earlier.
- The proof techniques will work for any fragment of first order logic provided it has successor.

- Trivial to prove that Duplicator wins using the strategy described earlier.
- The proof techniques will work for any fragment of first order logic provided it has successor.

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

If we have successor then in some sense we are getting modular separation "for free" because:

- Trivial to prove that Duplicator wins using the strategy described earlier.
- The proof techniques will work for any fragment of first order logic provided it has successor.
- If we have successor then in some sense we are getting modular separation "for free" because:
 - Use of successor to describe blocks of letters, effectively abstracting modularity

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

- Trivial to prove that Duplicator wins using the strategy described earlier.
- The proof techniques will work for any fragment of first order logic provided it has successor.
- If we have successor then in some sense we are getting modular separation "for free" because:
 - Use of successor to describe blocks of letters, effectively abstracting modularity

Language transformation is defined generically

- Trivial to prove that Duplicator wins using the strategy described earlier.
- The proof techniques will work for any fragment of first order logic provided it has successor.
- If we have successor then in some sense we are getting modular separation "for free" because:
 - Use of successor to describe blocks of letters, effectively abstracting modularity
 - Language transformation is defined generically
 - independence of strategy transfer on the number of rounds played in the EF game, reducing dependence of the proof on logical structure

Thank you!
