The story of a table of numbers

Number of vertices	1	2	3	4	5	6
All posets	1	2	5	16	63	318
... $(3 + 1)$ -free	1	2	5	15	49	173
... and $(2 + 2)$ -free	1	2	5	14	42	132

Number of vertices	7	8	9	10
All posets	2045	16999	183231	2567284
... $(3 + 1)$ -free	639	2469	9997	43109
... and $(2 + 2)$ -free	429	1430	4862	16796

The graded case: (Lewis-Zhang FPSAC 2012)

Colourings

Colourings

Colourings

Colourings

Colourings

Graphs:
independent sets

Posets:
chains

Stanley's chromatic symmetric functions

- **Chromatic polynomial** $\chi_G(n)$:
Polynomial function, counts the number of proper colourings with n colours.

Stanley's chromatic symmetric functions

- **Chromatic polynomial** $\chi_G(n)$:
Polynomial function, counts the number of proper colourings with n colours.
- **Chromatic symmetric function** $X_G(x_1, x_2, \dots)$:
Generating function for proper colourings, records the size of colour class i as the exponent of x_i .

Stanley's chromatic symmetric functions

- **Chromatic polynomial** $\chi_G(n)$:
Polynomial function, counts the number of proper colourings with n colours.
- **Chromatic symmetric function** $X_G(x_1, x_2, \dots)$:
Generating function for proper colourings, records the size of colour class i as the exponent of x_i .
- **Chromatic symmetric function** $X_P(x_1, x_2, \dots)$:
Generating function for chain colourings, records the size of colour class i as the exponent of x_i .

Example

$$X_P(x_1, x_2, \dots)$$

$$= x_1^3 x_2 + x_2^3 x_1 + x_1^3 x_3 + 6x_1^2 x_2 x_3 + \dots$$

$$(3 + 1)$$

Example

$(3 + 1)$

$$X_P(x_1, x_2, \dots)$$

$$= x_1^3 x_2 + x_2^3 x_1 + x_1^3 x_3 + 6x_1^2 x_2 x_3 + \dots$$

$$= m_{31} + 6m_{211} + 24m_{1111}$$

$$= p_{1111} - 3p_{211} + 3p_{31} - p_4$$

$$= 8s_{1111} + 5s_{211} - s_{22} + s_{31}$$

$$= e_{211} - 2e_{22} + 5e_{31} + 4e_4$$

$$= \dots$$

Example

$$X_P(x_1, x_2, \dots)$$

$$= x_1^3 x_2 + x_2^3 x_1 + x_1^3 x_3 + 6x_1^2 x_2 x_3 + \dots$$

$$= m_{31} + 6m_{211} + 24m_{1111}$$

$$= p_{1111} - 3p_{211} + 3p_{31} - p_4$$

$$= 8s_{1111} + 5s_{211} - s_{22} + s_{31}$$

$$= e_{211} - 2e_{22} + 5e_{31} + 4e_4$$

$$= \dots$$

Question:

Which posets have positive coefficients in which bases?

Stanley and Stembridge's conjecture (1993)

The data:

Contains ($3 + 1$)?	<i>e</i> -positive?	$n = 4$	$n = 5$	$n = 6$	$n = 7$
Yes	Yes	0	5	39	469
Yes	No	1	9	106	938
No	Yes	15	49	173	639
No	No	0	0	0	0

Stanley and Stembridge's conjecture (1993)

The data:

Contains ($3 + 1$)?	e -positive?	$n = 4$	$n = 5$	$n = 6$	$n = 7$
Yes	Yes	0	5	39	469
Yes	No	1	9	106	938
No	Yes	15	49	173	639
No	No	0	0	0	0

Stanley and Stembridge's conjecture (1993)

The data:

Contains (3 + 1)?	<i>e</i> -positive?	$n = 4$	$n = 5$	$n = 6$	$n = 7$
Yes	Yes	0	5	39	469
Yes	No	1	9	106	938
No	Yes	15	49	173	639
No	No	0	0	0	0

The conjecture:

If a poset P is $(3 + 1)$ -free, then its chromatic symmetric function $X_P(x_1, x_2, \dots)$ is *e*-positive.

Stanley and Stembridge's conjecture (1993)

The data:

Contains $(3 + 1)$?	e -positive?	$n = 4$	$n = 5$	$n = 6$	$n = 7$
Yes	Yes	0	5	39	469
Yes	No	1	9	106	938
No	Yes	15	49	173	639
No	No	0	0	0	0

The conjecture:

If a poset P is $(3 + 1)$ -free, then its chromatic symmetric function $X_P(x_1, x_2, \dots)$ is e -positive.

Theorem (Gasharov 1996):

P is $(3 + 1)$ -free implies $X_P(x_1, x_2, \dots)$ is s -positive.

Numbers again

Number of vertices	1	2	3	4	5	6
All posets	1	2	5	16	63	318
... $(3 + 1)$ -free	1	2	5	15	49	173
... and $(2 + 2)$ -free	1	2	5	14	42	132

Number of vertices	7	8	9	10

Generating posets: level by level

First idea:

Construct each poset one level at a time, starting from the minimal elements.

Generating posets: focus on adjacent levels

Observation:

If vertices are more than one level apart, they are comparable.

Generating posets: focus on adjacent levels

Observation:

If vertices are more than one level apart, they are comparable.

Proof:

Generating posets: focus on adjacent levels

Generating posets: up-degree and down-degree

High up-degree:

High down-degree:

Both:

Generating posets: combing

Generating posets: combing

Generating posets: combing

Sorted components for combing

Generating posets: tangles

Observation 1:

$(2 + 2)$ cannot be decomposed by combing.

Generating posets: tangles

Observation 1:

$(2 + 2)$ cannot be decomposed by combing.

Observation 2:

Irreducible components are single vertices or connected by copies of $(2 + 2)$.

Generating function for tangles

“A bicoloured graph can be decomposed uniquely as a list of vertices above, vertices below, and tangles.”

Generating function for tangles

“A bicoloured graph can be decomposed uniquely as a list of vertices above, vertices below, and tangles.”

$$B(x, y) = \frac{1}{1 - x - y - T(x, y)}$$

Generating function for tangles

“A bicoloured graph can be decomposed uniquely as a list of vertices above, vertices below, and tangles.”

$$B(x, y) = \frac{1}{1 - x - y - T(x, y)}$$

$$T(x, y) = 1 - x - y - \frac{1}{B(x, y)}$$

Generating poset: sorting all levels

Theorem:

Sorting the vertices of a level by combining with the level above or by combining with the level below gives compatible orderings.

In particular, tangles on different levels do not overlap.

Generating function for skeleta

Theorem:

There is a bijection between skeleta of $(3 + 1)$ -free posets and certain decorated Dyck paths.

Generating function for skeleta

Theorem:

There is a bijection between skeleta of $(3 + 1)$ -free posets and certain decorated Dyck paths.

$$S(c, t) = \sum_{r, s \geq 0} \binom{\# \text{ of skeleta with} \\ r \text{ clone sets and} \\ s \text{ tangles}}{c^r t^s}$$

Generating function for skeleta

Theorem:

There is a bijection between skeleta of $(3 + 1)$ -free posets and certain decorated Dyck paths.

$$S(c, t) = \sum_{r, s \geq 0} \binom{\# \text{ of skeleta with} \\ r \text{ clone sets and} \\ s \text{ tangles}}{r, s} c^r t^s$$

$$S(c, t) = 1 + \frac{c}{1+c} S(c, t)^2 + t S(c, t)^3$$

Numbers once more

Number of vertices	1	2	3	4	5	6
All posets	1	2	5	16	63	318
... $(3 + 1)$ -free	1	2	5	15	49	173
... and $(2 + 2)$ -free	1	2	5	14	42	132

Number of vertices	7	8	9	10
All posets	2045	16999	183231	2567284
... $(3 + 1)$ -free	639	2469	9997	43109
... and $(2 + 2)$ -free	429	1430	4862	16796

Bonus

Theorem:

The e -positivity conjecture only needs to be checked for the smaller class of $(3 + 1)$ -and- $(2 + 2)$ -free posets.

Computation:

The e -positivity conjecture has been checked for all posets on up to 20 vertices.

Thank you!

Bijection with (certain) Dyck paths

Modular relation

$$\begin{aligned} & \text{CSF} \left(\begin{array}{c} \text{---} \\ \text{---} \end{array} \begin{array}{c} \bullet \\ \bullet \quad \bullet \end{array} \begin{array}{c} \text{---} \\ \text{---} \end{array} \right) + \text{CSF} \left(\begin{array}{c} \text{---} \\ \text{---} \end{array} \begin{array}{c} \bullet \\ \bullet \quad \bullet \end{array} \begin{array}{c} \text{---} \\ \text{---} \end{array} \right) \\ &= \text{CSF} \left(\begin{array}{c} \text{---} \\ \text{---} \end{array} \begin{array}{c} \bullet \\ \bullet \quad \bullet \end{array} \begin{array}{c} \text{---} \\ \text{---} \end{array} \right) + \text{CSF} \left(\begin{array}{c} \text{---} \\ \text{---} \end{array} \begin{array}{c} \bullet \\ \bullet \quad \bullet \end{array} \begin{array}{c} \text{---} \\ \text{---} \end{array} \right) \end{aligned}$$

The diagram illustrates a modular relation between two sums of CSF (Cubic Surface Function) terms. Each term is represented by a triangle with three vertices and three edges, enclosed in a yellow square. The vertices are marked with black dots, and the edges are either solid or dashed. The top and bottom edges of the square are marked with horizontal dashed lines. The first sum shows a triangle with solid edges, and the second sum shows a triangle with dashed edges. The equality indicates that the sum of these two terms is equal to the sum of two terms where the edges are swapped: one with a solid left edge and dashed right edge, and another with a dashed left edge and solid right edge.

Extra numbers
